Optorun acquires new orders for ALD equipment from a major new customer

Optorun has won orders for new advanced ALD equipment for deposition of lenses from an Asia-based world leader in manufacturing camera lens modules for smartphones and other devices. This will make us a key player in the global supply chain in the U.S. and East Asia and further increase our presence in the global market in the future.

Optorun's ALD equipment combines ALD with its plasma technology, and for camera lenses such as smartphones and mini LEDs, it is capable of forming films on extremely thin and diverse target materials that cannot be achieved with conventional optical thin film technologies. In the future, opportunities for further new orders are expected to contribute to our growth through the application of the technology to a variety of new products in IoT area. During the first two quarters of this fiscal year, orders for ALD equipment have already grown at a pace that exceeds the annual orders received in the previous year.

To accelerate the development, production and sales of ALD equipment, we are currently preparing to establish a new subsidiary in China where major demand for the technology application exists.
